### Resolved issues

- Auto-exposure does not work when gain is not zero
- Gain will stay within **GainAutoMin** and **GainAutoMax** in auto modes

## Known issues

Gain feature should be set to zero when using ExposureAuto and GainAuto features together. Otherwise exposure value could remain constant.

### Resolved issues

- BayerGR12Packed pixel format changed to BayerRG12Packed
- Chunk data displayed is from the previous frame.
- `AutoExposureOnce` does not work if `ExposureTimeAbs` is set to a value less than 100  $\mu$ s before imaging.

- When **BinningVertical** > 8 using a packed pixel format, the camera stops responding and requires a power cycle to continue streaming (Manta G-504C).

### Limitations

- Manta G-032B: **ReverseX** is not supported
- Manta G-145: Enabling **Binning** with **OffsetY** > 0 stops camera streaming
- Manta G-201-30fps: When selecting an Region of Interest, only even **OffsetX** or **OffsetY** numbers are supported.

  - When **ExposureMode** = *Timed*: Improved accuracy in exposure calculation with deviation < 1  $\mu$ s, exposure calculation takes into account exposure time error (**tOFFSET**)
  - Partial Fix: When **ExposureMode** = *TriggerWidth*, you will see improved accuracy in exposure calculation with deviation  $\leq$  one **ExposureTimeIncrement**, For a given trigger pulse width, effective exposure duration will be trigger pulse width plus exposure time error (**tOFFSET**)

Exposure time error (**tOFFSET**) = 13.73  $\mu$ s from Sony IMX249, IMX264, and IMX265 data sheets.

- Added support for sensor readout mode in Mako G-234B and G-234C models
  - This allows you to choose between 10-bit and 12-bit (default) sensor readout. 10-bit sensor readout can achieve relatively higher frame rates, especially 8-bit pixel formats and also in a small Region of Interest.

### Changes

- Frame rates, exposure minimum, exposure maximum values, **ExposureTimeIncrement**, trigger jitter and trigger latency values are updated for Mako G-234B and G-234C:

Specification	Firmware version 01.54.15954	Firmware version 01.54.18032
Maximum frame rate	40 fps	41.2 fps
Exposure control	53 $\mu$ s to 73 s; 19.86 $\mu$ s increments	52 $\mu$ s to 71 s; 19.3 $\mu$ s increments
Trigger latency	69.6 $\mu$ s	58.2 $\mu$ s
Trigger Jitter	$\pm$ 9.8 $\mu$ s	$\pm$ 9.6 $\mu$ s

Values in this table reflect 8-bit pixel formats (Mono8 and BayerRG8) and 10-bit sensor readout mode at full resolution.

Table 2: Timing values for Mako G-234B and 234C

## Resolved issues

- GVCP command drop (no Ack)
- In auto gain and auto exposure, current value will stay within the range in accordance to minimum and maximum value changes
- Camera no longer ignores ARP message responses sent to IP Address 0.0.0.0 if that is the camera's current IP address (which it is on power-up).
- White flicker at minimum exposure and maximum gain no longer occurs.
- When ReverseX is enabled, changing the pixel format to YUV format will keep **Width** less than **WidthMax**.

## Limitations

- Pixel format, binning, and decimation are changeable only when the camera is not streaming.
- The Mako G-507C does not support **BinningY**

  - EventLine3FallingEdgeTimestamp
  - EventLine3RisingEdgeFrameID
  - EventLine3RisingEdgeTimestamp
  - EventLine4FallingEdgeFrameID

  - EventLine4RisingEdgeFrameID
  - EventLine4RisingEdgeTimestamp
- The corresponding events in the EventSelector were also removed: Line3RisingEdge, Line3FallingEdge, Line4RisingEdge, and Line4FallingEdge

## Changes

- Differences in frame rates: Some of the new Prosilica GC hardware revision D models require to use different imager frequencies. Therefore it is difficult to apply the same frame rates as Prosilica GC hardware revision A models. As a side effect higher frame rates can be achieved:

Models	Frame rate for Prosilica GC hardware revision A models	Frame rate for Prosilica GC hardware revision D models
Prosilica GC660	119.30 fps	121.20 fps
Prosilica GC1290	32.79 fps	33.31 fps
Prosilica GC1380H	30.01 fps	30.49 fps

All other Prosilica GC hardware revision D models support the same frame rates as the previous Prosilica GC models.

- Features renamed: On Prosilica GC hardware revision A models, **Gain** is called **GainRaw**; on the new Prosilica GC hardware revision D models it is referred to as **Gain**. This is just a name change to be GenICam SFNC compliant; the functionality remains the same. **GainRaw** is still available, but now it is an invisible attribute that can still be applied by programmers (**PvAPI** users for example).
- Due to the increased memory the new models have an extended **StreamHoldCapacity**. The changes are as follows:

Models	StreamHoldCapacity for Prosilica GC hardware revision A models	StreamHoldCapacity for Prosilica GC hardware revision D models
Prosilica GC660	46 frames	194 frames
Prosilica GC1290	12 frames	52 frames
Prosilica GC1380H	11 frames	46 frames
Prosilica GC1600H	7 frames	33 frames
Prosilica GC2450	3 frames	12 frames

- Prosilica GC hardware revision A models support five user sets, the new Prosilica GC hardware revision D models support three user sets.

## Limitations

- IEEE 1588-2008 Precision Time Protocol related limitations
  - PTP in this firmware version has many improvements, some of which cause PTP incompatibility issues with cameras running older firmware versions.
  - When using PTP in a network with cameras running a mix of older and newer PTP firmware, **PtpMode = Auto** can not be used, and the master camera (**PtpMode = Master**) must be a camera running the newer firmware version.
  - To take full advantage of the latest PTP resolved issues and improvements, it is recommended to upgrade the firmware of the listed supported models.
